

# Ch 24 – Nuclear Chemistry

## Selected NChO Problems

1999-30.	<p><b>(C) 34 y</b></p> <p>Roughly, the tritium decays from 100% → 50% → 25% → 12.5% so the answer is between 2 and 3 half-lives, that is, between 25 years and 37.5 years. There is only one answer in that range.</p>
1995-30.	<p><b>(A) <math>9.6 \times 10^{-3} \text{ s}^{-1}</math></b></p> $\ln 2 = kt_{1/2} \text{ so, } k = \frac{\ln 2}{t_{1/2}} = \frac{0.693}{72\text{s}} = 0.009625 \text{ s}^{-1} = \mathbf{9.6 \times 10^{-3} \text{ s}^{-1}}$
1994-29.	<p><b>(B) first</b></p> <p>I guess you just have to memorize this idea. Remember that radioactivity is first order and the half life is constant (i.e., does not depend on the concentration of the reactant).</p>
1993-39.	<p><b>(A) <math>{}_{26}\text{Fe}^{59}</math></b></p> <p>(A) <math>59 - 26 = 33</math>                      (C) <math>61 - 30 = 31</math>            (B) <math>61 - 29 = 32</math>                      (D) <math>60 - 30 = 30</math></p>
1993-40.	<p><b>(A) alpha</b></p> <p>Alpha decay example: <math>{}_{92}^{238}\text{U} \rightarrow {}_{90}^{234}\text{Th} + {}_2^4\text{He}</math>            mass number changes: <math>238 \rightarrow 234</math>    atomic number changes: <math>92 \rightarrow 90</math></p>
1992-1.	<p><b>(C) <math>92\text{p}^+ \ 92\text{e}^- \ 143\text{n}^0</math></b></p> <p>U = 92 protons;    neutral species means <math>\#e^- = \#p^+</math>;    <math>235 - 92 = 143\text{n}^0</math></p>
1992-65.	<p><b>(B) 0.00462</b></p> $\ln 2 = kt_{1/2} \text{ so, } k = \frac{\ln 2}{t_{1/2}} = \frac{0.693}{150 \text{ min}} = 0.00462 \text{ min}^{-1}$
1991-59.	<p><b>(C) 18,600 years</b></p> <p>“90% of a sample to decompose” translates into “10% remains”  <math>100\% \rightarrow 50\% \rightarrow 25\% \rightarrow 12.5\% \rightarrow 6.25\%</math>            The estimate is roughly between 3 &amp; 4 half-lives, that is, between 16,710 yrs and 22,800 yrs.            Two answers fit that range so we need to <i>calculate</i> the actual answer.</p> $\ln 2 = kt_{1/2} \text{ so, } k = \frac{\ln 2}{t_{1/2}} = \frac{0.693}{5570 \text{ yrs}} = 1.244 \times 10^{-4} \text{ yrs}^{-1}$ $\ln\left(\frac{[A]_0}{[A]_t}\right) = kt \quad \ln\left(\frac{100\%}{10\%}\right) = (1.244 \times 10^{-4} \text{ yrs}^{-1})t \quad \ln 10 = (1.244 \times 10^{-4} \text{ yrs}^{-1})t$ $2.302 = (1.244 \times 10^{-4} \text{ yrs}^{-1})t \quad t = \frac{2.302}{(1.244 \times 10^{-4} \text{ yrs}^{-1})} = \mathbf{18,509 \text{ years}}$
1990-26.	<p><b>(A) 40.0 mg</b></p> $\frac{12.00}{6.00} = 2 \text{ half lives}$ <p><math>x \rightarrow x \rightarrow 10.0 \text{ mg} \quad \mathbf{40.0 \text{ mg}} \rightarrow 20.0 \text{ mg} \rightarrow 10.0 \text{ mg}</math></p>
1990-36.	<p><b>(D) 26 electrons, 26 protons, 30 neutrons</b></p> <p>Fe (atomic number = 26)            This is a neutral atom, so <math>\#e^- = \#p^+ = 26</math>.  <math>\#n^0 = 56 - 26 = 30</math> neutrons</p>
